

# Optimization

February 14, 2020

## 0.1 Optimization for Fully Connected Networks

In this notebook, we will implement different optimization rules for gradient descent. We have provided starter code; however, you will need to copy and paste your code from your implementation of the modular fully connected nets in HW #3 to build upon this.

CS231n has built a solid API for building these modular frameworks and training them, and we will use their very well implemented framework as opposed to “reinventing the wheel.” This includes using their Solver, various utility functions, and their layer structure. This also includes `nndl.fc_net`, `nndl.layers`, and `nndl.layer_utils`. As in prior assignments, we thank Serena Yeung & Justin Johnson for permission to use code written for the CS 231n class ([cs231n.stanford.edu](http://cs231n.stanford.edu)).

```
In [5]: ## Import and setups
```

```
import time
import numpy as np
import matplotlib.pyplot as plt
from nndl.fc_net import *
from cs231n.data_utils import get_CIFAR10_data
from cs231n.gradient_check import eval_numerical_gradient, eval_numerical_gradient_array
from cs231n.solver import Solver

%matplotlib inline
plt.rcParams['figure.figsize'] = (10.0, 8.0) # set default size of plots
plt.rcParams['image.interpolation'] = 'nearest'
plt.rcParams['image.cmap'] = 'gray'

# for auto-reloading external modules
# see http://stackoverflow.com/questions/1907993/autoreload-of-modules-in-ipython
%load_ext autoreload
%autoreload 2

def rel_error(x, y):
    """ returns relative error """
    return np.max(np.abs(x - y) / (np.maximum(1e-8, np.abs(x) + np.abs(y))))
```

The autoreload extension is already loaded. To reload it, use:

```
%reload_ext autoreload
```

```
In [6]: # Load the (preprocessed) CIFAR10 data.
```

```
data = get_CIFAR10_data()
for k in data.keys():
    print('{}: {}'.format(k, data[k].shape))
```

```
X_train: (49000, 3, 32, 32)
y_train: (49000,)
X_val: (1000, 3, 32, 32)
y_val: (1000,)
X_test: (1000, 3, 32, 32)
y_test: (1000,)
```

## 0.2 Building upon your HW #3 implementation

Copy and paste the following functions from your HW #3 implementation of a modular FC net:

- `affine_forward` in `nndl/layers.py`
- `affine_backward` in `nndl/layers.py`
- `relu_forward` in `nndl/layers.py`
- `relu_backward` in `nndl/layers.py`
- `affine_relu_forward` in `nndl/layer_utils.py`
- `affine_relu_backward` in `nndl/layer_utils.py`
- The `FullyConnectedNet` class in `nndl/fc_net.py`

### 0.2.1 Test all functions you copy and pasted

```
In [8]: from nndl.layer_tests import *
```

```
affine_forward_test(); print('\n')
affine_backward_test(); print('\n')
relu_forward_test(); print('\n')
relu_backward_test(); print('\n')
affine_relu_test(); print('\n')
fc_net_test()
```

If `affine_forward` function is working, difference should be less than  $1e-9$ :  
difference:  $9.769849468192957e-10$

If `affine_backward` is working, error should be less than  $1e-9$ ::  
dx error:  $1.4447320222555285e-09$   
dw error:  $1.1047309246240456e-10$   
db error:  $2.7377408054883514e-11$

If `relu_forward` function is working, difference should be around  $1e-8$ :  
difference:  $4.999999798022158e-08$

If relu\_forward function is working, error should be less than 1e-9:  
dx error: 3.2756091601249265e-12

If affine\_relu\_forward and affine\_relu\_backward are working, error should be less than 1e-9::  
dx error: 8.62708664453249e-10  
dw error: 4.3006763454630695e-10  
db error: 4.233047189421872e-12

## 1 Training a larger model

In general, proceeding with vanilla stochastic gradient descent to optimize models may be fraught with problems and limitations, as discussed in class. Thus, we implement optimizers that improve on SGD.

### 1.1 SGD + momentum

In the following section, implement SGD with momentum. Read the `nndl/optim.py` API, which is provided by CS231n, and be sure you understand it. After, implement `sgd_momentum` in `nndl/optim.py`. Test your implementation of `sgd_momentum` by running the cell below.

```
In [9]: from nndl.optim import sgd_momentum
```

```
N, D = 4, 5
w = np.linspace(-0.4, 0.6, num=N*D).reshape(N, D)
dw = np.linspace(-0.6, 0.4, num=N*D).reshape(N, D)
v = np.linspace(0.6, 0.9, num=N*D).reshape(N, D)
```

```

config = {'learning_rate': 1e-3, 'velocity': v}
next_w, _ = sgd_momentum(w, dw, config=config)

expected_next_w = np.asarray([
    [ 0.1406,      0.20738947,  0.27417895,  0.34096842,  0.40775789],
    [ 0.47454737,  0.54133684,  0.60812632,  0.67491579,  0.74170526],
    [ 0.80849474,  0.87528421,  0.94207368,  1.00886316,  1.07565263],
    [ 1.14244211,  1.20923158,  1.27602105,  1.34281053,  1.4096    ]])
expected_velocity = np.asarray([
    [ 0.5406,      0.55475789,  0.56891579,  0.58307368,  0.59723158],
    [ 0.61138947,  0.62554737,  0.63970526,  0.65386316,  0.66802105],
    [ 0.68217895,  0.69633684,  0.71049474,  0.72465263,  0.73881053],
    [ 0.75296842,  0.76712632,  0.78128421,  0.79544211,  0.8096    ]])

print('next_w error: {}'.format(rel_error(next_w, expected_next_w)))
print('velocity error: {}'.format(rel_error(expected_velocity, config['velocity'])))

next_w error: 8.882347033505819e-09
velocity error: 4.269287743278663e-09

```

## 1.2 SGD + Nesterov momentum

Implement `sgd_nesterov_momentum` in `ndl/optim.py`.

In [10]: `from ndl.optim import sgd_nesterov_momentum`

```

N, D = 4, 5
w = np.linspace(-0.4, 0.6, num=N*D).reshape(N, D)
dw = np.linspace(-0.6, 0.4, num=N*D).reshape(N, D)
v = np.linspace(0.6, 0.9, num=N*D).reshape(N, D)

config = {'learning_rate': 1e-3, 'velocity': v}
next_w, _ = sgd_nesterov_momentum(w, dw, config=config)

expected_next_w = np.asarray([
    [0.08714,      0.15246105,  0.21778211,  0.28310316,  0.34842421],
    [0.41374526,  0.47906632,  0.54438737,  0.60970842,  0.67502947],
    [0.74035053,  0.80567158,  0.87099263,  0.93631368,  1.00163474],
    [1.06695579,  1.13227684,  1.19759789,  1.26291895,  1.32824    ]])
expected_velocity = np.asarray([
    [ 0.5406,      0.55475789,  0.56891579,  0.58307368,  0.59723158],
    [ 0.61138947,  0.62554737,  0.63970526,  0.65386316,  0.66802105],
    [ 0.68217895,  0.69633684,  0.71049474,  0.72465263,  0.73881053],
    [ 0.75296842,  0.76712632,  0.78128421,  0.79544211,  0.8096    ]])

print('next_w error: {}'.format(rel_error(next_w, expected_next_w)))
print('velocity error: {}'.format(rel_error(expected_velocity, config['velocity'])))

```

```
next_w error: 1.0875186845081027e-08
velocity error: 4.269287743278663e-09
```

### 1.3 Evaluating SGD, SGD+Momentum, and SGD+NesterovMomentum

Run the following cell to train a 6 layer FC net with SGD, SGD+momentum, and SGD+Nesterov momentum. You should see that SGD+momentum achieves a better loss than SGD, and that SGD+Nesterov momentum achieves a slightly better loss (and training accuracy) than SGD+momentum.

```
In [11]: num_train = 4000
        small_data = {
            'X_train': data['X_train'][:num_train],
            'y_train': data['y_train'][:num_train],
            'X_val': data['X_val'],
            'y_val': data['y_val'],
        }

        solvers = {}

        for update_rule in ['sgd', 'sgd_momentum', 'sgd_nesterov_momentum']:
            print('Optimizing with {}'.format(update_rule))
            model = FullyConnectedNet([100, 100, 100, 100, 100], weight_scale=5e-2)

            solver = Solver(model, small_data,
                            num_epochs=5, batch_size=100,
                            update_rule=update_rule,
                            optim_config={
                                'learning_rate': 1e-2,
                            },
                            verbose=False)
            solvers[update_rule] = solver
            solver.train()
            print

        fig, axes = plt.subplots(3, 1)

        ax = axes[0]
        ax.set_title('Training loss')
        ax.set_xlabel('Iteration')

        ax = axes[1]
        ax.set_title('Training accuracy')
        ax.set_xlabel('Epoch')

        ax = axes[2]
        ax.set_title('Validation accuracy')
```

```

ax.set_xlabel('Epoch')

for update_rule, solver in solvers.items():
    ax = axes[0]
    ax.plot(solver.loss_history, 'o', label=update_rule)

    ax = axes[1]
    ax.plot(solver.train_acc_history, '-o', label=update_rule)

    ax = axes[2]
    ax.plot(solver.val_acc_history, '-o', label=update_rule)

for i in [1, 2, 3]:
    ax = axes[i - 1]
    ax.legend(loc='upper center', ncol=4)
plt.gcf().set_size_inches(15, 15)
plt.show()

```

Optimizing with `sgd`  
 Optimizing with `sgd_momentum`  
 Optimizing with `sgd_nesterov_momentum`

## 1.4 RMSProp

Now we go to techniques that adapt the gradient. Implement `rmsprop` in `nndl/optim.py`. Test your implementation by running the cell below.

In [12]: `from nndl.optim import rmsprop`

```
N, D = 4, 5
w = np.linspace(-0.4, 0.6, num=N*D).reshape(N, D)
dw = np.linspace(-0.6, 0.4, num=N*D).reshape(N, D)
a = np.linspace(0.6, 0.9, num=N*D).reshape(N, D)

config = {'learning_rate': 1e-2, 'a': a}
next_w, _ = rmsprop(w, dw, config=config)
```

```

expected_next_w = np.asarray([
    [-0.39223849, -0.34037513, -0.28849239, -0.23659121, -0.18467247],
    [-0.132737, -0.08078555, -0.02881884, 0.02316247, 0.07515774],
    [ 0.12716641, 0.17918792, 0.23122175, 0.28326742, 0.33532447],
    [ 0.38739248, 0.43947102, 0.49155973, 0.54365823, 0.59576619]])
expected_cache = np.asarray([
    [ 0.5976, 0.6126277, 0.6277108, 0.64284931, 0.65804321],
    [ 0.67329252, 0.68859723, 0.70395734, 0.71937285, 0.73484377],
    [ 0.75037008, 0.7659518, 0.78158892, 0.79728144, 0.81302936],
    [ 0.82883269, 0.84469141, 0.86060554, 0.87657507, 0.8926 ]])

print('next_w error: {}'.format(rel_error(expected_next_w, next_w)))
print('cache error: {}'.format(rel_error(expected_cache, config['a'])))

```

```

next_w error: 9.524687511038133e-08
cache error: 2.6477955807156126e-09

```

## 1.5 Adaptive moments

Now, implement adam in `nndl/optim.py`. Test your implementation by running the cell below.

```

In [13]: # Test Adam implementation; you should see errors around 1e-7 or less
from nndl.optim import adam

```

```

N, D = 4, 5
w = np.linspace(-0.4, 0.6, num=N*D).reshape(N, D)
dw = np.linspace(-0.6, 0.4, num=N*D).reshape(N, D)
v = np.linspace(0.6, 0.9, num=N*D).reshape(N, D)
a = np.linspace(0.7, 0.5, num=N*D).reshape(N, D)

config = {'learning_rate': 1e-2, 'v': v, 'a': a, 't': 5}
next_w, _ = adam(w, dw, config=config)

expected_next_w = np.asarray([
    [-0.40094747, -0.34836187, -0.29577703, -0.24319299, -0.19060977],
    [-0.1380274, -0.08544591, -0.03286534, 0.01971428, 0.0722929],
    [ 0.1248705, 0.17744702, 0.23002243, 0.28259667, 0.33516969],
    [ 0.38774145, 0.44031188, 0.49288093, 0.54544852, 0.59801459]])
expected_a = np.asarray([
    [ 0.69966, 0.68908382, 0.67851319, 0.66794809, 0.65738853],
    [ 0.64683452, 0.63628604, 0.6257431, 0.61520571, 0.60467385],
    [ 0.59414753, 0.58362676, 0.57311152, 0.56260183, 0.55209767],
    [ 0.54159906, 0.53110598, 0.52061845, 0.51013645, 0.49966, ]])
expected_v = np.asarray([
    [ 0.48, 0.49947368, 0.51894737, 0.53842105, 0.55789474],

```

```
print('next_w error: {}'.format(rel_error(expected_next_w, next_w)))
print('a error: {}'.format(rel_error(expected_a, config['a'])))
print('v error: {}'.format(rel_error(expected_v, config['v'])))
```

```
next_w error: 1.1395691798535431e-07
a error: 4.208314038113071e-09
v error: 4.214963193114416e-09
```

## 1.6 Comparing SGD, SGD+NesterovMomentum, RMSProp, and Adam

The following code will compare optimization with SGD, Momentum, Nesterov Momentum, RMSProp and Adam. In our code, we find that RMSProp, Adam, and SGD + Nesterov Momentum achieve approximately the same training error after a few training epochs.

```
In [14]: learning_rates = {'rmsprop': 2e-4, 'adam': 1e-3}
```

```
for update_rule in ['adam', 'rmsprop']:
    print('Optimizing with {}'.format(update_rule))
    model = FullyConnectedNet([100, 100, 100, 100, 100], weight_scale=5e-2)

    solver = Solver(model, small_data,
                    num_epochs=5, batch_size=100,
                    update_rule=update_rule,
                    optim_config={
                        'learning_rate': learning_rates[update_rule]
                    },
                    verbose=False)
    solvers[update_rule] = solver
    solver.train()
    print

fig, axes = plt.subplots(3, 1)

ax = axes[0]
ax.set_title('Training loss')
ax.set_xlabel('Iteration')

ax = axes[1]
ax.set_title('Training accuracy')
ax.set_xlabel('Epoch')

ax = axes[2]
ax.set_title('Validation accuracy')
ax.set_xlabel('Epoch')
```

```

for update_rule, solver in solvers.items():
    ax = axes[0]
    ax.plot(solver.loss_history, 'o', label=update_rule)

    ax = axes[1]
    ax.plot(solver.train_acc_history, '-o', label=update_rule)

    ax = axes[2]
    ax.plot(solver.val_acc_history, '-o', label=update_rule)

for i in [1, 2, 3]:
    ax = axes[i - 1]
    ax.legend(loc='upper center', ncol=4)
plt.gcf().set_size_inches(15, 15)
plt.show()

```

Optimizing with adam  
 Optimizing with rmsprop

## 1.7 Easier optimization

In the following cell, we'll train a 4 layer neural network having 500 units in each hidden layer with the different optimizers, and find that it is far easier to get up to 50+% performance on CIFAR-10. After we implement batchnorm and dropout, we'll ask you to get 55+% on CIFAR-10.

```
In [15]: optimizer = 'adam'
         best_model = None

         layer_dims = [500, 500, 500]
         weight_scale = 0.01
         learning_rate = 1e-3
         lr_decay = 0.9
```

```

model = FullyConnectedNet(layer_dims, weight_scale=weight_scale,
                           use_batchnorm=True)

solver = Solver(model, data,
                 num_epochs=10, batch_size=100,
                 update_rule=optimizer,
                 optim_config={
                     'learning_rate': learning_rate,
                 },
                 lr_decay=lr_decay,
                 verbose=True, print_every=50)

solver.train()

(Iteration 1 / 4900) loss: 2.318372

def batchnorm_forward(x, gamma, beta, bn_param):
    """
    Forward pass for batch normalization.

    During training the sample mean and (uncorrected) sample variance are
    computed from minibatch statistics and used to normalize the incoming data.
    During training we also keep an exponentially decaying running mean of the mean
    and variance of each feature, and these averages are used to normalize data
    at test-time.

```

At each timestep we update the running averages for mean and variance using an exponential decay based on the momentum parameter:

```
running_mean = momentum * running_mean + (1 - momentum) * sample_mean
running_var = momentum * running_var + (1 - momentum) * sample_var
```

Note that the batch normalization paper suggests a different test-time behavior: they compute sample mean and variance for each feature using a large number of training images rather than using a running average. For this implementation we have chosen to use running averages instead since they do not require an additional estimation step; the torch7 implementation of batch normalization also uses running averages.

Input:

- *x*: Data of shape (N, D)
- *gamma*: Scale parameter of shape (D,)
- *beta*: Shift parameter of shape (D,)
- *bn\_param*: Dictionary with the following keys:
  - *mode*: 'train' or 'test'; required
  - *eps*: Constant for numeric stability
  - *momentum*: Constant for running mean / variance.
  - *running\_mean*: Array of shape (D,) giving running mean of features
  - *running\_var*: Array of shape (D,) giving running variance of features

Returns a tuple of:

- *out*: of shape (N, D)
- *cache*: A tuple of values needed in the backward pass

"""

"""
This file implements various first-order update rules that are commonly used for
training neural networks. Each update rule accepts current weights and the
gradient of the loss with respect to those weights and produces the next set of
weights. Each update rule has the same interface:

def update(w, dw, config=None):

Inputs:
- w: A numpy array giving the current weights.
- dw: A numpy array of the same shape as w giving the gradient of the
    loss with respect to w.
- config: A dictionary containing hyperparameter values such as learning rate,
    momentum, etc. If the update rule requires caching values over many

```

*iterations, then config will also hold these cached values.*

*Returns:*

- next\_w: The next point after the update.*
- config: The config dictionary to be passed to the next iteration of the update rule.*

*NOTE: For most update rules, the default learning rate will probably not perform well; however the default values of the other hyperparameters should work well for a variety of different problems.*

*For efficiency, update rules may perform in-place updates, mutating w and setting next\_w equal to w.*

# Batch-Normalization

February 14, 2020

## 1 Batch Normalization

In this notebook, you will implement the batch normalization layers of a neural network to increase its performance. Please review the details of batch normalization from the lecture notes.

CS231n has built a solid API for building these modular frameworks and training them, and we will use their very well implemented framework as opposed to “reinventing the wheel.” This includes using their Solver, various utility functions, and their layer structure. This also includes `nndl.fc_net`, `nndl.layers`, and `nndl.layer_utils`. As in prior assignments, we thank Serena Yeung & Justin Johnson for permission to use code written for the CS 231n class ([cs231n.stanford.edu](http://cs231n.stanford.edu)).

```
In [1]: ## Import and setups
```

```
import time
import numpy as np
import matplotlib.pyplot as plt
from nndl.fc_net import *
from nndl.layers import *
from cs231n.data_utils import get_CIFAR10_data
from cs231n.gradient_check import eval_numerical_gradient, eval_numerical_gradient_array
from cs231n.solver import Solver

%matplotlib inline
plt.rcParams['figure.figsize'] = (10.0, 8.0) # set default size of plots
plt.rcParams['image.interpolation'] = 'nearest'
plt.rcParams['image.cmap'] = 'gray'

# for auto-reloading external modules
# see http://stackoverflow.com/questions/1907993/autoreload-of-modules-in-ipython
%load_ext autoreload
%autoreload 2

def rel_error(x, y):
    """ returns relative error """
    return np.max(np.abs(x - y) / (np.maximum(1e-8, np.abs(x) + np.abs(y))))
```

```
In [2]: # Load the (preprocessed) CIFAR10 data.
```

```
data = get_CIFAR10_data()
```

```

for k in data.keys():
    print('{}: {}'.format(k, data[k].shape))

X_train: (49000, 3, 32, 32)
y_train: (49000,)
X_val: (1000, 3, 32, 32)
y_val: (1000,)
X_test: (1000, 3, 32, 32)
y_test: (1000,)

```

## 1.1 Batchnorm forward pass

Implement the training time batchnorm forward pass, `batchnorm_forward`, in `nndl/layers.py`. After that, test your implementation by running the following cell.

```

In [3]: # Check the training-time forward pass by checking means and variances
        # of features both before and after batch normalization

        # Simulate the forward pass for a two-layer network
        N, D1, D2, D3 = 200, 50, 60, 3
        X = np.random.randn(N, D1)
        W1 = np.random.randn(D1, D2)
        W2 = np.random.randn(D2, D3)
        a = np.maximum(0, X.dot(W1)).dot(W2)

        print('Before batch normalization:')
        print('  means: ', a.mean(axis=0))
        print('  stds: ', a.std(axis=0))

        # Means should be close to zero and stds close to one
        print('After batch normalization (gamma=1, beta=0)')
        a_norm, _ = batchnorm_forward(a, np.ones(D3), np.zeros(D3), {'mode': 'train'})
        print('  mean: ', a_norm.mean(axis=0))
        print('  std: ', a_norm.std(axis=0))

        # Now means should be close to beta and stds close to gamma
        gamma = np.asarray([1.0, 2.0, 3.0])
        beta = np.asarray([11.0, 12.0, 13.0])
        a_norm, _ = batchnorm_forward(a, gamma, beta, {'mode': 'train'})
        print('After batch normalization (nontrivial gamma, beta)')
        print('  means: ', a_norm.mean(axis=0))
        print('  stds: ', a_norm.std(axis=0))

```

Before batch normalization:

```

means: [37.92392543 28.09237194 -3.04969567]
stds:  [34.78471832 25.74155703 24.37582532]

```

After batch normalization (gamma=1, beta=0)

```

mean:  [ 6.19504448e-16 -4.81698015e-16  3.88578059e-17]

```

```

std: [1.          0.99999999 0.99999999]
After batch normalization (nontrivial gamma, beta)
means: [11. 12. 13.]
stds: [1.          1.99999998 2.99999997]

```

Implement the testing time batchnorm forward pass, `batchnorm_forward`, in `nndl/layers.py`. After that, test your implementation by running the following cell.

```

In [4]: # Check the test-time forward pass by running the training-time
        # forward pass many times to warm up the running averages, and then
        # checking the means and variances of activations after a test-time
        # forward pass.

N, D1, D2, D3 = 200, 50, 60, 3
W1 = np.random.randn(D1, D2)
W2 = np.random.randn(D2, D3)

bn_param = {'mode': 'train'}
gamma = np.ones(D3)
beta = np.zeros(D3)
for t in np.arange(50):
    X = np.random.randn(N, D1)
    a = np.maximum(0, X.dot(W1)).dot(W2)
    batchnorm_forward(a, gamma, beta, bn_param)
bn_param['mode'] = 'test'
X = np.random.randn(N, D1)
a = np.maximum(0, X.dot(W1)).dot(W2)
a_norm, _ = batchnorm_forward(a, gamma, beta, bn_param)

# Means should be close to zero and stds close to one, but will be
# noisier than training-time forward passes.
print('After batch normalization (test-time):')
print(' means: ', a_norm.mean(axis=0))
print(' stds: ', a_norm.std(axis=0))

```

```

After batch normalization (test-time):
means: [0.0145487  0.08299104 0.00142647]
stds:  [0.95813208 1.07410707 1.04147374]

```

## 1.2 Batchnorm backward pass

Implement the backward pass for the batchnorm layer, `batchnorm_backward` in `nndl/layers.py`. Check your implementation by running the following cell.

```

In [5]: # Gradient check batchnorm backward pass

N, D = 4, 5

```

```

x = 5 * np.random.randn(N, D) + 12
gamma = np.random.randn(D)
beta = np.random.randn(D)
dout = np.random.randn(N, D)

bn_param = {'mode': 'train'}
fx = lambda x: batchnorm_forward(x, gamma, beta, bn_param)[0]
fg = lambda a: batchnorm_forward(x, gamma, beta, bn_param)[0]
fb = lambda b: batchnorm_forward(x, gamma, beta, bn_param)[0]

dx_num = eval_numerical_gradient_array(fx, x, dout)
da_num = eval_numerical_gradient_array(fg, gamma, dout)
db_num = eval_numerical_gradient_array(fb, beta, dout)

_, cache = batchnorm_forward(x, gamma, beta, bn_param)
dx, dgamma, dbeta = batchnorm_backward(dout, cache)
print('dx error: ', rel_error(dx_num, dx))
print('dgamma error: ', rel_error(da_num, dgamma))
print('dbeta error: ', rel_error(db_num, dbeta))

dx error:  2.1298178158532375e-09
dgamma error:  2.8064035777574576e-11
dbeta error:  8.832378711339843e-12

```

### 1.3 Implement a fully connected neural network with batchnorm layers

Modify the `FullyConnectedNet()` class in `nndl/fc_net.py` to incorporate batchnorm layers. You will need to modify the class in the following areas:

- (1) The gammas and betas need to be initialized to 1's and 0's respectively in `__init__`.
- (2) The `batchnorm_forward` layer needs to be inserted between each affine and relu layer (except in the output layer) in a forward pass computation in `loss`. You may find it helpful to write an `affine_batchnorm_relu()` layer in `nndl/layer_utils.py` although this is not necessary.
- (3) The `batchnorm_backward` layer has to be appropriately inserted when calculating gradients.

After you have done the appropriate modifications, check your implementation by running the following cell.

Note, while the relative error for `W3` should be small, as we backprop gradients more, you may find the relative error increases. Our relative error for `W1` is on the order of  $1e-4$ .

```

In [8]: N, D, H1, H2, C = 2, 15, 20, 30, 10
        X = np.random.randn(N, D)
        y = np.random.randint(C, size=(N,))

        for reg in [0, 3.14]:

```

```

print('Running check with reg = ', reg)
model = FullyConnectedNet([H1, H2], input_dim=D, num_classes=C,
                           reg=reg, weight_scale=5e-2, dtype=np.float64,
                           use_batchnorm=True)

loss, grads = model.loss(X, y)
print('Initial loss: ', loss)

for name in sorted(grads):
    f = lambda _: model.loss(X, y)[0]
    grad_num = eval_numerical_gradient(f, model.params[name], verbose=False, h=1e-5)
    print('{} relative error: {}'.format(name, rel_error(grad_num, grads[name])))
if reg == 0: print('\n')

```

```

Running check with reg = 0

## 1.6 Question:

In the cell below, summarize the findings of this experiment, and WHY these results make sense.

## 1.7 Answer:

1. Batchnorm makes the model less sensitive to the initialization of the parameters (like  $w$ 's). In the loss figures, the loss function of the model with batchnorm (orange) is pretty consistent the weight initialization range changing only around 0.3 unit. Whereas within the same range of weight initialization the loss function of the baseline changes drastically (from 2.3 to around 1).
2. The training and validation accuracies with batch norm tend to change less sensitive with respect to weight initializations in comparison with baseline model.

## 2 layers

def batchnorm_forward(x, gamma, beta, bn_param):
    """
    Forward pass for batch normalization.

    During training the sample mean and (uncorrected) sample variance are
    computed from minibatch statistics and used to normalize the incoming data.
    During training we also keep an exponentially decaying running mean of the mean
    and variance of each feature, and these averages are used to normalize data
    at test-time.

    At each timestep we update the running averages for mean and variance using
    an exponential decay based on the momentum parameter:

    running_mean = momentum * running_mean + (1 - momentum) * sample_mean
    running_var = momentum * running_var + (1 - momentum) * sample_var

    Note that the batch normalization paper suggests a different test-time
    behavior: they compute sample mean and variance for each feature using a
    large number of training images rather than using a running average. For
    this implementation we have chosen to use running averages instead since
    they do not require an additional estimation step; the torch7 implementation
    of batch normalization also uses running averages.

    Input:
    - x: Data of shape (N, D)
    - gamma: Scale parameter of shape (D,)
    - beta: Shift paremeter of shape (D,)
    - bn_param: Dictionary with the following keys:
        - mode: 'train' or 'test'; required
        - eps: Constant for numeric stability
        - momentum: Constant for running mean / variance.
        - running_mean: Array of shape (D,) giving running mean of features

# Dropout

February 14, 2020

## 1 Dropout

In this notebook, you will implement dropout. Then we will ask you to train a network with batchnorm and dropout, and achieve over 55% accuracy on CIFAR-10.

CS231n has built a solid API for building these modular frameworks and training them, and we will use their very well implemented framework as opposed to “reinventing the wheel.” This includes using their Solver, various utility functions, and their layer structure. This also includes `nndl.fc_net`, `nndl.layers`, and `nndl.layer_utils`. As in prior assignments, we thank Serena Yeung & Justin Johnson for permission to use code written for the CS 231n class ([cs231n.stanford.edu](http://cs231n.stanford.edu)).

```
In [1]: ## Import and setups
```

```
import time
import numpy as np
import matplotlib.pyplot as plt
from nndl.fc_net import *
from nndl.layers import *
from cs231n.data_utils import get_CIFAR10_data
from cs231n.gradient_check import eval_numerical_gradient, eval_numerical_gradient_array
from cs231n.solver import Solver

%matplotlib inline
plt.rcParams['figure.figsize'] = (10.0, 8.0) # set default size of plots
plt.rcParams['image.interpolation'] = 'nearest'
plt.rcParams['image.cmap'] = 'gray'

# for auto-reloading external modules
# see http://stackoverflow.com/questions/1907993/autoreload-of-modules-in-ipython
%load_ext autoreload
%autoreload 2

def rel_error(x, y):
    """ returns relative error """
    return np.max(np.abs(x - y) / (np.maximum(1e-8, np.abs(x) + np.abs(y))))
```

```
In [2]: # Load the (preprocessed) CIFAR10 data.
```

```

data = get_CIFAR10_data()
for k in data.keys():
    print('{}: {}'.format(k, data[k].shape))

X_train: (49000, 3, 32, 32)
y_train: (49000,)
X_val: (1000, 3, 32, 32)
y_val: (1000,)
X_test: (1000, 3, 32, 32)
y_test: (1000,)

```

## 1.1 Dropout forward pass

Implement the training and test time dropout forward pass, `dropout_forward`, in `nndl/layers.py`. After that, test your implementation by running the following cell.

```

In [4]: x = np.random.randn(500, 500) + 10

for p in [0.3, 0.6, 0.75]:
    out, _ = dropout_forward(x, {'mode': 'train', 'p': p})
    out_test, _ = dropout_forward(x, {'mode': 'test', 'p': p})

    print('Running tests with p = ', p)
    print('Mean of input: ', x.mean())
    print('Mean of train-time output: ', out.mean())
    print('Mean of test-time output: ', out_test.mean())
    print('Fraction of train-time output set to zero: ', (out == 0).mean())
    print('Fraction of test-time output set to zero: ', (out_test == 0).mean())

```

```

Running tests with p = 0.3
Mean of input: 9.99812212819963
Mean of train-time output: 10.009874517210564
Mean of test-time output: 9.99812212819963
Fraction of train-time output set to zero: 0.699664
Fraction of test-time output set to zero: 0.0
Running tests with p = 0.6
Mean of input: 9.99812212819963
Mean of train-time output: 9.992874352483557
Mean of test-time output: 9.99812212819963
Fraction of train-time output set to zero: 0.400224
Fraction of test-time output set to zero: 0.0
Running tests with p = 0.75
Mean of input: 9.99812212819963
Mean of train-time output: 9.992721331061508
Mean of test-time output: 9.99812212819963
Fraction of train-time output set to zero: 0.250392
Fraction of test-time output set to zero: 0.0

```

## 1.2 Dropout backward pass

Implement the backward pass, `dropout_backward`, in `nndl/layers.py`. After that, test your gradients by running the following cell:

```
In [5]: x = np.random.randn(10, 10) + 10
        dout = np.random.randn(*x.shape)

        dropout_param = {'mode': 'train', 'p': 0.8, 'seed': 123}
        out, cache = dropout_forward(x, dropout_param)
        dx = dropout_backward(dout, cache)
        dx_num = eval_numerical_gradient_array(lambda xx: dropout_forward(xx, dropout_param)[0],
                                                x, dx)

        print('dx relative error: ', rel_error(dx, dx_num))

dx relative error: 5.445611179049964e-11
```

## 1.3 Implement a fully connected neural network with dropout layers

Modify the `FullyConnectedNet()` class in `nndl/fc_net.py` to incorporate dropout. A dropout layer should be incorporated after every ReLU layer. Concretely, there shouldn't be a dropout at the output layer since there is no ReLU at the output layer. You will need to modify the class in the following areas:

- (1) In the forward pass, you will need to incorporate a dropout layer after every relu layer.
- (2) In the backward pass, you will need to incorporate a dropout backward pass layer.

Check your implementation by running the following code. Our  $W_1$  gradient relative error is on the order of  $1e-6$  (the largest of all the relative errors).

```
In [6]: N, D, H1, H2, C = 2, 15, 20, 30, 10
        X = np.random.randn(N, D)
        y = np.random.randint(C, size=(N,))

        for dropout in [0.5, 0.75, 1.0]:
            print('Running check with dropout = ', dropout)
            model = FullyConnectedNet([H1, H2], input_dim=D, num_classes=C,
                                      weight_scale=5e-2, dtype=np.float64,
                                      dropout=dropout, seed=123)

            loss, grads = model.loss(X, y)
            print('Initial loss: ', loss)

            for name in sorted(grads):
                f = lambda _: model.loss(X, y)[0]
                grad_num = eval_numerical_gradient(f, model.params[name], verbose=False, h=1e-5)
                print('{} relative error: {}'.format(name, rel_error(grad_num, grads[name])))
            print('\n')
```

```

## 1.4 Dropout as a regularizer

In class, we claimed that dropout acts as a regularizer by effectively bagging. To check this, we will train two small networks, one with dropout and one without dropout.

```
In [7]: # Train two identical nets, one with dropout and one without
```

```
num_train = 500
small_data = {
    'X_train': data['X_train'][:num_train],
    'y_train': data['y_train'][:num_train],
    'X_val': data['X_val'],
    'y_val': data['y_val'],
}

solvers = {}
```

```

dropout_choices = [0.6, 1.0]
for dropout in dropout_choices:
    model = FullyConnectedNet([100, 100, 100], dropout=dropout)

    solver = Solver(model, small_data,
                    num_epochs=25, batch_size=100,
                    update_rule='adam',
                    optim_config={
                        'learning_rate': 5e-4,
                    },
                    verbose=True, print_every=100)

## 1.5 Question

Based off the results of this experiment, is dropout performing regularization? Explain your answer.

## 1.6 Answer:

Yes it does regularization. Because of the fact that the model with and without dropout have very similar validation accuracies as it can be seen from the bottom figure. However, the model without dropout (blue) has significantly higher training accuracy compared to the model with dropout (orange) as it can be seen from the top figure. This means that the additional training accuracy the model without dropout has is overfitting and the model with dropout, in fact, regularize it. As mentioned in the class we can also think of the dropout in fact regularizing each hidden unit to work well in many different contexts.

**Final part of the assignment** Get over 55% validation accuracy on CIFAR-10 by using the layers you have implemented. You will be graded according to the following equation:

$\min(\text{floor}((X - 32\%)) / 23\%, 1)$  where if you get 55% or higher validation accuracy, you get full points.

```

def batchnorm_forward(x, gamma, beta, bn_param):
    """
    Forward pass for batch normalization.

    During training the sample mean and (uncorrected) sample variance are
    computed from minibatch statistics and used to normalize the incoming data.
    During training we also keep an exponentially decaying running mean of the mean
    and variance of each feature, and these averages are used to normalize data
    at test-time.

    At each timestep we update the running averages for mean and variance using
    an exponential decay based on the momentum parameter:

    running_mean = momentum * running_mean + (1 - momentum) * sample_mean
    running_var = momentum * running_var + (1 - momentum) * sample_var

    Note that the batch normalization paper suggests a different test-time
    behavior: they compute sample mean and variance for each feature using a
    large number of training images rather than using a running average. For
    this implementation we have chosen to use running averages instead since
    they do not require an additional estimation step; the torch7 implementation
    of batch normalization also uses running averages.

    Input:
    - x: Data of shape (N, D)
    - gamma: Scale parameter of shape (D,)
    - beta: Shift parameter of shape (D,)
    - bn_param: Dictionary with the following keys:
        - mode: 'train' or 'test'; required
        - eps: Constant for numeric stability
        - momentum: Constant for running mean / variance.
        - running_mean: Array of shape (D,) giving running mean of features
        - running_var: Array of shape (D,) giving running variance of features

    Returns a tuple of:
    - out: of shape (N, D)
    - cache: A tuple of values needed in the backward pass
